

A large hospital uses Harmony Purple for Security Controls Effectiveness

A leading hospital required an efficient and effective testing solution that works 24/7 and provides real-time insights into security and business risks it can act on.

COMPANY SUMMARY

A leading hospital in Israel that serves over 1,000,000 citizens.

TESTIMONIAL

"Protecting the hospital's network is very challenging. We have many portals, complex networks between other hospitals and government departments, dedicated medical equipment, and more. Using Harmony Purple I can finally focus on what really matters."
Hospital CISO

CHALLENGES

The hospital was using human testers as well as automatic scanners. It wanted to find an alternative that was continuous and provided control for the in-house CISO 24/7. Moreover, they received too many alerts and false positives and did not gain true insights as to what alerts mattered or what their implications were.

SOLUTION

Orchestra Group has developed Harmony Purple, a next-generation vulnerability prioritization tool (VPT) that continuously showcases validated, global, multi-vector Attack Path Scenarios™ (APS), so organizations can focus their red team's and blue team's time and resources on those compensating remediation process that increase the security of their critical assets and business processes. Once Harmony Purple was installed in the hospital, the CISO received only relevant actionable insights that mattered to him, as well as efficient recommendations for effective remediation process.

BENEFITS

- Quick installation.
- In-house IT can manage Harmony Purple. There is no need for outsourced testers.
- Continuous operation 24/7 that matches today's dynamic and cloud-based environment.
- Extremely low false positives.
- Actionable business and security insights.
- Competitive pricing.
- Intuitive dashboard.
